ROADSTER LOOP.

A physical claim becomes a 3D explanation with a beginning that is also the ending.

Veronika's code-built interpretation of Tesla's Roadster loop demonstration. The car and track are original animation, not Tesla footage.

> **Materials first:** a narration voice or voice generator. No photos. No licensed music track. The reference uses a Runway-generated voice and music written in code. Check voice availability and rights before use.

EXPLAIN THE TRICK

The reel opens on the question of whether the stunt is AI, then follows suction, inverted grip, release, air thrust, and the short air supply. The final line returns to the first idea to make the loop.

0-11 s	Hook. Underfloor fans remove air and reduce pressure.
11-22 s	Explain the force across the floor and the upside-down section.
22-32 s	Release from the ceiling; show two carbon tanks and compressed air.
32-47 s	Nozzles, thrust, flip and descent.
47-58 s	The air-supply catch, then the suction-versus-thrust summary that loops.

Visual system: almost-black track and floor, icy blue pressure and air (#8FE3FF), white car, red tail light (#FF3B4A). Use camera travel, cutaways and large short labels to carry the explanation. The voice timing file has 12 narration blocks and a 1,748-frame composition at 30 fps.

PASTE THE BRIEF

CLAUDE CODE / COPY THIS

```
Read FIRST-REEL.md and EXAMPLES.md. Help me make a Roadster loop story
reel from this guide.

Build a 1080 x 1920 Remotion reel using three.js. Make an original white
sports car and loop track with no Tesla logos or stock footage. Start
with a question about whether the Roadster demonstration is AI, then
explain it through a moving 3D cutaway: fans pull air from under the
floor, lower pressure holds the car to the track, it drives upside down,
releases, air nozzles turn it upright, and it lands. End with the clear
contrast “Suction holds it on. Thrust throws it off.” Compose the last
moment to lead back to the opening frame.

Use the supplied project claims only. The project attributes
approximately 10 percent pressure change, 4.7 tonnes, more than 2 g, 600
liters and more than 80 kN to Tesla's demonstration. The two-second full-
thrust air estimate and 45 km/h fall estimate are the creator's
calculations, and must be labelled “my math” if used. Do not add any
other figures or claim these estimates are Tesla statements.

Style: near-black environment, icy blue airflow and pressure diagrams,
white car and a red tail-light accent. Keep captions crisp and still
enough to read. Use 1,748 frames at 30 fps. Before animating, write a 12-
row narration cue sheet with each block's exact start frame, end frame
and words, and show it to me for approval. Align the suction, inverted
grip, release, thrust, descent and final loop to that sheet, then freeze
it before rendering. Ask me for a voice or help me create and check one;
do not promise any voice service works. Synthesise original music and
effects in code. Make a draft and let me inspect the loop, motion and
audio.
```

Revision notes that help

“Make the pressure change understandable before showing the inverted car.”

“Label the creator's calculation at the moment it appears.”

“Compare the first and final frames; the loop should not jump.”

KEEP CLAIMS SEPARATE

- Present the animation as Veronika's reconstruction of a real demonstration, never as original Tesla footage.
- Distinguish project-attributed Tesla figures from the creator's own calculations. Keep the “my math” label with the latter.
- Leave out an unsourced safety cable. The project notes that its evidence was insufficient.
- Check narration timing against the twelve timed blocks in the source, then watch the final loop yourself.
- Listen to the rendered voice and music yourself. This guide does not claim to have heard the video.

> **Source limit:** the original `content-studio/out/roadster-loop/` working folder was absent from this workspace. The final source component, generated timing file, archive note and approved text package were available. No original one-shot prompt was found.
