MADE BY CODE. 2

How I made a 19-second showreel where one red ball does every transition: a Newton's cradle that flips the words, a dive through a letter, dominoes, a page flip, liquid, glass, an eclipse, 14 3D worlds behind one word. It never ends. No editing app, even the music is code. The full brief, ready to paste. Windows and Mac.

WHAT YOU GET

The sequel to my reel that hit 100K. Same red ball, same typography, all new transitions in real 3D: chrome, glass, liquid, light. Claude writes the typography, the 3D, the timing and the music. You write the words.

1	11	14	∞
RED BALL, THE ONLY HERO	TRANSITIONS THROUGH IT	3D WORLDS IN THE DROP	NO ENDING, A PERFECT LOOP

What you need

- A Windows 10/11 or macOS computer. Any graphics card helps: 3D renders are heavy.
- A Claude plan that includes Claude Code.
- Your words: six short words for the cradle, one word with an “o”, three scene words, your comment word.

WHY IT WORKS

01 · A claim
“No camera. No blender. Just words.” The viewer stays to check if it is true

02 · One hero
The red ball makes every transition. The eye follows it and never gets lost

03 · Physics you feel
A cradle, dominoes, a splash, glass. Real 3D that reacts on the beat

04 · No ending
The ball flies back into the cradle. People watch it twice without noticing

The one trick behind it

Every transition is a wave or a hole. On each click of the cradle the next page is clipped inside a growing circle that starts exactly at the contact point. For the dive, the blue page has a real hole cut in the “o”, and the next 3D scene is already rendered under it. The camera never cuts, it goes through.

> **Reel Studio buyers:** skip this section. The folder name, the install and the first Claude launch below are the steps I took when I built this reel on a clean computer. You already work in `My-Reel-Studio`, so open it and start from `FIRST-REEL.md`.

INSTALL THE TOOLS

1 Open a terminal

WINDOWS Press Win, type `PowerShell`, open it.

MAC Press Cmd + Space, type `Terminal`, open it.

2 Node.js, Git, Python and ffmpeg

WINDOWS Paste one line at a time. Answer `Y` when asked.

POWERSHELL

```
winget install -e --id OpenJS.NodeJS.LTS
winget install -e --id Git.Git
winget install -e --id Python.Python.3.13
winget install -e --id Gyan.FFmpeg
```

MAC Homebrew first, it will ask for your password. At the end it prints two lines under “Next steps”: run them, then run the second command.

TERMINAL · STEP 1

```
/bin/bash -c "$(curl -fsSL
https://raw.githubusercontent.com/Homebrew/install/HEAD/ins
tall.sh)"
```

TERMINAL · STEP 2

```
brew install node git python ffmpeg
```

> Important. Close the terminal and open it again after installing, or it will not see the new programs.

3 Claude Code

TERMINAL

```
npm install -g @anthropic-ai/claude-code
```

Prefer an app to a terminal? Install Claude from claude.ai/download, it has a Code tab that does the same thing.

FOLDER AND SETUP

1 Create a folder and start Claude

TERMINAL

```
mkdir ball-reel\ncd ball-reel\nclaude
```

2 Setup

PROMPT · SETUP

```
Set up a motion project in this folder.

1. Install Remotion (React 18 + TypeScript) with
@remotion/three, three and @react-three/fiber.
2. Check that Python has numpy and scipy. Install what is
missing.
3. Check that ffmpeg works from the terminal.
4. Build a test composition, 1080x1920, 60 fps: a word in a
heavy font on a cream background, and on top of it a
transparent three.js canvas with one glossy red ball and one
chrome ball, lit by an environment map. Render one frame to
PNG with the GL backend set to "angle" and show me the path.

If something is missing, install it yourself and tell me what
you installed. If something fails, find the cause and fix it.
```

THE REEL BRIEF

Words in square brackets are mine: put your own. The word for the dive needs an “o” (or any letter with a hole).

PROMPT · REEL BRIEF

Build a vertical kinetic typography showreel in Remotion, with three.js for every 3D object. 1080x1920, 60 fps, 19.2 seconds, a seamless loop with no ending. All text in English. Keep text out of the top 220 px and the bottom 380 px (the Instagram interface).

THE HERO
One small glossy red ball. It goes through the whole reel and every transition happens through it. Palette: black #09090B, cream #F1E8D6, red #FF4A17, electric blue #2133FF, plus real chrome and real glass. Font: Outfit 900 for words, Anton for the big word in the drop.

THE RULE
No cuts that come from nowhere. Every scene must turn into the next one through the ball or through the object on screen. If a transition can only be a cut, it lands on a hard beat with a short flash.

THE TIMELINE (150 BPM: one beat = 12 frames at 30 fps; work in 30 fps units and render at 60 fps)
1. NEWTON'S CRADLE (0-2.8 s). Five balls on strings under a chrome bar, the right one is the red ball. Every click of the cradle is a beat. On every click a circular wave spreads from the contact point; inside the circle the background flips (cream / black) and the next word is already there: [no / camera. / no / blender. / just / words.]. A thin red ring rides the edge of the wave. The swinging ball leaves a short ghost trail. A warm lamp glow behind the cradle, darker corners.
2. LAUNCH (2.8-3.3 s). The last click is too hard: the red ball tears off its string and flies up. The cradle slides out of frame upward. A blue wave opens [opus 5.5], where the "o" is a ring.
3. DIVE (3.3-4.2 s). The ball falls exactly into the hole of the "o". The camera dives after it. Through the hole you already see the next 3D scene, alive, so the dive lands inside it.
4. PHYSICS (4.2-6.8 s). 3D letters [PHYSICS.] stand on a dark floor under a warm spotlight. The ball drops in, rolls along the word and knocks the letters over one by one like dominoes, with a small bounce. A red light moves with the ball and tints the letters. The camera rises until it looks straight down and the fallen letters read [PHYSICS.] on the floor.
5. PAGE FLIP (6.8-7.4 s). The floor is a sheet of paper: it flips over on a hinge at its left edge, with the letters on

it. Under it there is milky liquid.
6. LIQUID (7.4-9.0 s). The ball falls into the liquid with rings that spread over the word [LIQUID.] printed on the surface, so the letters wobble with the waves. The camera tilts down to a low angle.
7. GLASS (9.0-10.4 s). The ball comes back up made of glass and flies straight into the camera. It lands in front of the word [GLASS.] and the word behind it bends and flips upside down, real refraction. The background light fades to black before the next scene.
8. ECLIPSE (10.4-12.8 s). The ball lights up like a sun. A black disc slides over it, a corona of rays bursts out and the text appears: [LIGHT / IS STILL / MATH.]. The disc grows to fill the frame on the last beat before the drop.
9. DROP (12.8-15.6 s). The word [claude] stands still in the middle. Behind it a new 3D world every half beat, 14 cuts, and the red ball is in each one: a planet with chrome rings, a pit of glossy balls, a glass ball over stripes, chrome pipes the ball rolls through, a wide shot of the cradle, a wave of spheres, balls orbiting a red sun. The word flips white / black on every cut and bounces a little.
10. MIRROR (15.6-16.4 s). The word shrinks into the center and a chrome ball grows out of it. In its reflection you read [OPUS 5.5]. The camera flies into the reflection.
11. CUBES (16.4-17.6 s). [OPUS 5.5] stands built from cubes, exactly as it was in the reflection. The camera pulls back, a wave runs through the cubes, then they burst toward the camera and the blue background goes black.
12. END (17.6-19.2 s). The red ball pops in. [made by / claude opus / 5.5], and a comment field types [your word]. Then a cream circle opens from the ball and the ball flies back to its place in the cradle: the last frame is the first frame.

STYLE
On every hit the whole frame punches in by 3-4% and settles, no shake. No blur on text. Every word stands still and whole for at least a few frames.

SOUND (synthesize in numpy, no samples, no tracks)
Mesmerizing and calm before the drop, heavy on the drop. F sharp minor, 150 BPM, chords F#m / D / A / E, one bar each, so 19.2 s is exactly 3 rounds and loops. The cradle clicks are tuned steel bells, each click a note of the theme. Under them a swaying marimba arpeggio on eighths with a dotted echo, a soft pad, a warm sub. Sound effects on the exact frames: string snap, whoosh, a soft tock into the letter, a riser into the dive, wooden clacks for each falling letter, a paper whoosh for the flip, a splash and an underwater bloop, a glass ting, a warm whoomp for the sun, a shimmer for the corona, a

riser and a cut to silence before the drop. On the drop: a punchy kick that you can hear on a phone (body around 58 Hz, plus distortion), bass, claps, hats, sidechain the pad. The cradle theme comes back quietly at the end so the loop is seamless. Reverb by convolution with decaying noise, normalized. Master to -14 LUFS, peak below -1 dB.

CHECK BEFORE YOU SAY DONE
1. Storyboard first: real frames from the code, 3-5 per transition.
2. A draft at 540x960 with sound.
3. Check the difference between neighbouring frames: any big jump that is not on a beat is a broken transition. Fix it.
4. Compare the first and the last frame: the loop must not jump.
5. Then the final 1080x1920. Tell me what you checked and what I should watch for in motion.

HOW TO FIX IT WITH NOTES

Watch the draft on your phone, on repeat. Then send notes like these. The first four are almost word for word what I wrote while making this reel.

MORE INTENSITY AND LIGHT

Yes, but the transitions and the light must be really intense and beautiful, especially the cradle. The sound must be mesmerizing, so people want to watch it again.

ILLOGICAL TRANSITIONS

Some transitions do not make sense. Every scene must turn into the next one through the ball or the object on screen. No cut from nowhere.

THE BIG WORD

The word in the middle of the drop is always white. Make it flip white and black on every cut.

A DEAD BLACK SCREEN

Before the drop there is half a second of plain black. Remove it: the black disc should fill the frame on the very last beat.

YOUR OWN WORDS

Replace the words with mine: [your cradle words], [your word with an o], [your scene words], [your comment word]. Keep one word per beat.

WHAT BROKE FOR ME

- **The reverb drowned everything.** The echo was hundreds of times louder than the music, so no change to the drums was audible. The fix: normalize the reverb before mixing.
- **The kick was silent on a phone.** At 42 Hz a phone speaker plays nothing. Moving the body up to 58 Hz and adding distortion made it hit.
- **Glow washed out the light scenes.** Bloom on a cream background turned it to milk. Glow stays only in dark scenes.
- **Some cuts came from nowhere.** The fix was the rule above: every scene turns into the next one through the ball. Checking the difference between neighbouring frames finds the cuts you missed.
- **Claude cannot hear or see motion.** It checks still frames and numbers. Whether it feels intense and hits the beat is your job: watch the draft before the final.

COMMON QUESTIONS

Can I make it about my brand?

Yes. Change the words and the colors. The ball can be your product: a coffee bean, a pill, a button.

Do I need to know code or 3D?

No. You need to know what you want to see and say it clearly. Claude builds the words, the 3D, the worlds and the music from code.

The terminal shows a red error. Now what?

Copy it and paste it to Claude with the words “here is the error, fix it and continue”.
