MADE BY CODE. 3

How I made a 19-second showreel inside a flipbook: a hand-drawn ball bounces page by page, smashes a word, jumps out of the paper as a real 3D ball and falls back into the drawing. 157 pages, it never ends. No editing app, even the music and every page sound are code. The full brief, ready to paste. Windows and Mac.

WHAT YOU GET

Part 3 of the red ball. This time the ball lives on paper: a real 3D flipbook flips the whole time, and every page is a frame drawn by code. Claude writes the drawings, the book, the timing and the music. You write the words.

157	1	2D→3D	∞
PAGES DRAWN BY CODE	BALL, THE ONLY HERO	OUT OF THE PAGE AND BACK	NO ENDING, A PERFECT LOOP

What you need

- A Windows 10/11 or macOS computer. Any graphics card helps: 3D renders are heavy.
- A Claude plan that includes Claude Code.
- Your words: six short hook words, one word to smash, four words for the hits, your comment word.

WHY IT WORKS

01 · Everyone knows it
A flipbook is a childhood toy. People recognize it in one second and want to see what is on the next page

02 · One hero
The red ball makes every transition. The eye follows it and never gets lost

03 · The surprise
A drawing jumps out of the paper as a real 3D ball, then falls back in. That is the moment people rewatch

04 · No ending
The last page turns and the first page is under it. People watch it twice without noticing

The one trick behind it

One schedule drives everything: a list of times when each page turns. Every page shows the drawing at the moment it was revealed, so the animation plays exactly like a paper flipbook, and the same list places a paper flip sound on every turn. Change the schedule and the whole reel speeds up or slows down in sync.

> **Reel Studio buyers:** skip this section. The folder name, the install and the first Claude launch below are the steps I took when I built this reel on a clean computer. You already work in `My-Reel-Studio`, so open it and start from `FIRST-REEL.md`.

INSTALL THE TOOLS

1 Open a terminal

WINDOWS Press Win, type `PowerShell`, open it.

MAC Press Cmd + Space, type `Terminal`, open it.

2 Node.js, Git, Python and ffmpeg

WINDOWS Paste one line at a time. Answer `Y` when asked.

POWERSHELL

```
winget install -e --id OpenJS.NodeJS.LTS
winget install -e --id Git.Git
winget install -e --id Python.Python.3.13
winget install -e --id Gyan.FFmpeg
```

MAC Homebrew first, it will ask for your password. At the end it prints two lines under “Next steps”: run them, then run the second command.

TERMINAL · STEP 1

```
/bin/bash -c "$(curl -fsSL
https://raw.githubusercontent.com/Homebrew/install/HEAD/ins
tall.sh)"
```

TERMINAL · STEP 2

```
brew install node git python ffmpeg
```

> Important. Close the terminal and open it again after installing, or it will not see the new programs.

3 Claude Code

TERMINAL

```
npm install -g @anthropic-ai/claude-code
```

Prefer an app to a terminal? Install Claude from claude.ai/download, it has a Code tab that does the same thing.

FOLDER AND SETUP

1 Create a folder and start Claude

TERMINAL

```
mkdir flipbook-reel\ncd flipbook-reel\nclaude
```

2 Setup

PROMPT · SETUP

```
Set up a motion project in this folder.

1. Install Remotion (React 18 + TypeScript) with
@remotion/three, three and @react-three/fiber.
2. Check that Python has numpy and scipy. Install what is
missing.
3. Check that ffmpeg works from the terminal.
4. Build a test composition, 1080x1920, 60 fps: a three.js
scene with a closed book lying on a blue desk, seen from
above, soft daylight from the upper left with real shadows.
Draw a red ball on its top page with a canvas texture. Render
one frame to PNG with the GL backend set to "angle" and show
me the path.

If something is missing, install it yourself and tell me what
you installed. If something fails, find the cause and fix it.
```

THE REEL BRIEF

Words in square brackets are mine: put your own.

PROMPT · REEL BRIEF

Build a vertical showreel in Remotion, with three.js for the 3D. 1080x1920, 60 fps, 19.2 seconds, a seamless loop with no ending. All text in English. Keep text out of the top 220 px and the bottom 380 px (the Instagram interface).

THE IDEA
The whole reel is one real 3D flipbook lying on a desk. It never stops flipping. On its pages a hand-drawn red ball is animated page by page, like a real flipbook, and the ball makes every transition. At one moment it jumps out of the paper as a real 3D ball, and later falls back into the drawing.

THE LOOK
Palette: cream paper #F3EEE4, tomato #FF5233, cobalt desk #2B45FF, butter #FFD23F, ink #17140F. Soft daylight from the upper left, real shadows, no tone mapping (it turns cobalt into lavender). Every page is a canvas texture: paper grain, ink lines 6 px, the ball filled tomato with a small white highlight. The lines wobble a little from page to page (draw the circle with a slightly different radius noise on every page), so it feels hand drawn. A page number in the corner. Font: Outfit 900 on the pages, Anton for the big word in the drop.

THE BOOK
Pages are 9:16, hinged on the left. A turning page is a bent plane: the far edge lifts first and the paper curls over, it never stretches. The page block under the top page is a bit smaller and lower than the page, so it never shows through at the spine. The top page casts a real shadow on the next one while it turns. Already turned pages pile up on the left.

THE SCHEDULE
Write one list of times when each page turns. Each page shows the drawing at the moment it was revealed. Normal pace: a page every 3 frames (at 30 fps). Bursts: 4 pages in 6 frames. Riffle: a page every frame. Use the same list for the picture and for the page sounds.

THE TIMELINE (150 BPM: one beat = 12 frames at 30 fps; work in 30 fps units and render at 60 fps)
1. HOOK (0-2.8 s). The camera looks down at the book. The drawn ball bounces on a word and lands on it exactly on every beat, with squash on contact and stretch in the air. On every beat a new page color and a new word: [this / is / not /

paper. / it's / code.].
2. SMASH (2.8-4.4 s). The ball lands hard on [code.]: the letters fly apart and fall onto a drawn floor line. Three bounces, then the ball grows in the middle of the page as if it comes toward you.
3. OUT OF THE PAGE (4.4-7.2 s). The drawn ball disappears and a real glossy 3D ball rises out of the page at the same spot and size. The camera drops low and orbits the book. The ball hits the book four times on the beat, and every hit flips a burst of pages with one big word: [DRAW. / FLIP. / BOUNCE. / REPEAT.].
4. BACK INTO THE DRAWING (7.2-9.6 s). The 3D ball shrinks to the drawn size and lands exactly where the drawing continues. The camera is back above the book. One animation principle per beat, with its word: [SQUASH. / STRETCH. / SPIN. / SPLIT.]. On the last beat the two halves meet and the ball grows until the page is all tomato.
5. MULTIPLY (9.6-12 s). Cream balls on tomato pages, each bouncing in its own cell: x2, x4, x8, x16, x32, x64, doubling on every beat. Pages flip faster and faster, the last half second is a riffle.
6. DROP (12-15.2 s). The word [claude] stands still in the middle. The book keeps flipping and the camera cuts every half beat to a new angle: top, low left, close, low right. Every half beat a new drawing on the pages: a ball planet with a ring, ripples, a grid wave of balls, a spiral, a loop with a trail, a sunrise. The desk color changes on every cut. The word flips black / cream on every cut and bounces a little.
7. END (15.2-19.2 s). A short riffle stops on the last page: [made by / claude opus / 5.5] and a comment field that types [your word]. A small ball bounces on the send button on every beat. Then the last page turns and under it is the very first page: the last frame is the first frame.

STYLE
On every hit the whole frame punches in by 3% and settles, no shake. No blur on text.

SOUND (synthesize in numpy, no samples, no tracks)
Mesmerizing and calm before the drop, full on the drop. C major / A minor, 150 BPM, chords Cmaj7 / Em7 / Am9 / Fmaj7#11, one bar each. Plucked strings made with Karplus-Strong on sixteenths with a ping-pong echo, a wordless choir pad through vowel formants, a warm sub. A soft paper flip on every page turn from the same schedule, a rubbery bonk every time the drawn ball touches the line, a deep thud on the paper block for every 3D hit, cartoon boings for squash, stretch, spin and split, a swarm of tiny pops for the multiplying balls, key clicks for the typing. On the drop: kick, bass, finger snaps,

shaker, sidechain the music. Reverb by convolution with decaying noise, normalized. Master to -14 LUFS, peak below -1 dB.

CHECK BEFORE YOU SAY DONE
1. Storyboard first: real frames from the code, 3-5 per transition.
2. A draft at 540x960 with sound.
3. Check the difference between neighbouring frames: a big jump must be a page turn or a beat.
4. Compare the first and the last frame: the loop must not jump.
5. Then the final 1080x1920. Tell me what you checked and what I should watch for in motion.

HOW TO FIX IT WITH NOTES

Watch the draft on your phone, on repeat. Then send notes like these. The first three are almost word for word what I wrote while making this reel: it started as a reel about light, then about paper, and only then became a flipbook.

NOT THE COLORS

I don't like these colors. Make a beautiful showreel and invent new transitions.

PUT THE ACCENT THERE

The page flipping where the ball bounces is really cool. Make the whole reel about that, the rest is weak.

A LINE AT THE SPINE

There is a black line along the left edge of the page. Find what shows through and fix it.

YOUR OWN WORDS

Replace the words with mine: [your six hook words], [the word the ball smashes], [four words for the hits], [your comment word]. Keep one word per beat.

WHAT BROKE FOR ME

- **The first two versions were weak.** Neon light on black, then paper tricks. Both were rejected. The flipbook was hiding inside version two as one scene. If one moment in your draft is the best, rebuild the whole reel around it.
- **The colors looked washed out.** Film tone mapping turned cobalt into lavender and tomato into salmon. Turning it off and lowering the light gave clean paint colors.
- **A black line at the spine.** The page block was the same size as the page and showed through it. Make the block a little smaller and lower.
- **A page turning straight at the camera looks blank.** From straight above it just fills the screen. Tilt the camera a little and the curl and its shadow read at once.
- **Claude cannot hear or see motion.** It checks still frames and numbers. Whether it feels good and hits the beat is your job: watch the draft before the final.

COMMON QUESTIONS

Can I make it about my brand?

Yes. Change the words and the colors. The ball can be your product, and the last page can be your logo.

Do I need to know code, 3D or drawing?

No. You need to know what you want to see and say it clearly. Claude draws every page, builds the book and writes the music from code.

The terminal shows a red error. Now what?

Copy it and paste it to Claude with the words “here is the error, fix it and continue”.
